

Michael Ikese Emmanuel

Backend Developer — Go

emmanlemichel2019@gmail.com • 08160345977 • github.com/miikese • Keffi, Nigeria • Open to remote work

PROFILE

Backend developer focused on Go, building HTTP servers, APIs, and command-line tools from the ground up using the standard library. Currently studying software development, with a working knowledge of Python as well. Comfortable working independently through a structured, project-based curriculum, and open to remote opportunities.

PROJECTS

ascii-art foundations (ValidateBanner / MergeBanners)

Go · runes · strings.Builder

Foundational ASCII-art rendering engine built on `map[rune][]string` banner maps — the banner-parsing core that later became `ascii-art-web`. Established patterns reused across later projects: rune indexing, nil-map detection, slice-length validation.

ascii-art-web

Go · net/http · html/template

A Go HTTP server serving a web GUI for ASCII art generation, supporting three banner styles with live switching. Renders entirely server-side with no client-side JS framework or CSS build step.

HTTP echo & form server

Go · net/http · Bash

A Go HTTP server built from scratch handling `/echo` and `/form` endpoints, with Content-Type enforcement, empty-body rejection, and field validation. Verified with a Bash smoke-test script.

ascii-art-color

Go · code review

Group project extending a shared `ascii-art` codebase with terminal color support via a `--color` flag, using only the Go standard library. Code review caught an empty-substring crash risk and spec-wording mismatches before ship.

SKILLS

Go • Python • HTTP/REST • net/http • Linux • Git • CSS basics • Project management

EDUCATION

Software Development — LEEF Centre, Otukpo

Structured, project-based curriculum covering Go from fundamentals through backend HTTP services; program has since expanded into Python.
